

BoundaryScore™ Data Covenant

The BoundaryScore™ Data Covenant defines the protections governing confidential participant evidence: limited collection, participant ownership, controlled disclosure, layered security and market outputs that do not expose or reconstruct protected participant data.

1 Participant data remains participant-owned.

Participant-generated Machine-State Metadata remains the property of the participant and is used only within the agreed BoundaryScore™ evaluation framework.

2 Collection is limited to what the evaluation requires.

BoundaryScore™ seeks only the operational evidence needed to calculate, validate, maintain and explain the rating. Broad or unrelated access is outside scope.

3 Core proprietary information is outside scope.

No source code, model weights, training datasets, proprietary algorithms or planning logic, internal developer communications, unrestricted network access, or write/control access is required.

4 Raw and granular participant records are not commercial products.

Raw Machine-State Metadata, raw event-burst evidence and granular identified operating records are not sold or disclosed to competitors, subscribers, suppliers or unrelated third parties.

5 Identified disclosure remains participant-controlled.

Granular identified BoundaryScore™ evidence is shared with commercial counterparties only when the participant affirmatively authorizes the disclosure, except where disclosure is legally required.

6 Protected data cannot be reconstructed from market outputs.

BoundaryScore™ does not release market outputs that permit protected participant data to be identified, inferred, reconstructed or reverse engineered. If a proposed slice creates an identification path, it is not released.

7 Protection is layered and enforced.

Aggregation, normalization, obfuscation, suppression, access controls, cybersecurity, policy and contractual restrictions operate together to prevent unauthorized disclosure and re-identification.

8 Participants retain full access; rating independence remains intact.

Each participant retains access to its own observations, metrics, events, trends, version comparisons and reconciled results. These protections do not alter independent methodology, valid findings or accurate historical records.
